ALLOY C14410

A High Conductivity CuSn0.15 Alloy

C14410 is a dilute tin copper alloy released to support legacy programs developed over the past 15 years, which are not sufficient in size to justify testing and qualification of an improved system like PMX 151 or C19015. Our research lab and product development team easily brought this alloy to market given more than 24 years of corporate experience with specialty alloys.

PMX can produce C14410 to current ASTM B152 and B888 and other industry standards. While PMX alloys like C19015 and 151 have improved formability, relaxation and coating adhesion compared to C14410, PMX can produce the alloy to your current quality requirements.

While we can commit to supporting your ongoing C14410 projects, we encourage you to seriously evaluate our newly developed systems (C19015) which deliver enhanced performance, especially when combined with PMX high temperature Sn28M. These new technologies will enable your connector designs to use thinner materials, carry more current, operate more reliably and reduce

insertion force. Our improved systems provides a viable alternative to advance barrier tins/reflow and a lower cost, lower insertion force option to pure silver. Sn28M can be mated with pure tin, pure silver, electroplates and reflow terminals without concern for mismatch. Additionally, Sn28M is compliant with today's lead-free solder system.

Enhanced performance and controlled total system costs – Available and supported through the PMX Alliance...That's the PMX Difference.
